

### **Abstract of the Disclosure**

A timepiece, in particular a watch or a wrist watch, has a housing with a display and an interface capable of being connected to an integrated electronic circuit. To provide a watch with which various functions, in particular also cashless payment transactions, are made possible, a receptacle for the integrated electronic circuit designed as an exchangeable chip with contacts arranged thereon is provided within the housing, the receptacle having elements for contacting the contacts of the integrated electronic circuit in its inserted position, wherein the contacting elements are connected to the interface and to a device for contactless transmission of data.
